The reduction  
lemma

The Sticky  
Face Lemma

Proof

Review

If  $P$  is a nonempty polyhedral convex subset of  $\mathbb{R}^n$ , then

- $\Pi_P$  denotes the Euclidean projector on  $P$
- $T_P$  and  $N_P$  are respectively the tangent-cone and normal-cone operators of  $P$ .
- For subsets  $X$  and  $Y$  of  $\mathbb{R}^n$  the *excess of  $X$  over  $Y$*  is

$$e(X, Y) = \inf\{\alpha \geq 0 \mid X \subset Y + \alpha B^n\},$$

where  $B^n$  is the unit ball.

## Definition

Let  $P$  be a nonempty polyhedral convex subset of  $\mathbb{R}^n$ . For any point  $z \in \mathbb{R}^n$  let  $x = \Pi_P(z)$  and  $n^* = z - x$ . Then

$$\phi_P(z) := P \cap \{x + [\text{pos}(-n^*)]^\circ\}$$

is the *critical face* of  $P$  for  $z$ . Also,

$$\kappa_P(z) := T_P(x) \cap [\text{pos}(-n^*)]^\circ$$

is the *critical cone* of  $P$  for  $z$ .

The critical face  $\phi_P(z)$  is a nonempty face of  $P$  that is also expressible as  $N_P^{-1}(n^*)$ . The critical cone  $\kappa_P(z)$  is a nonempty face of  $T_P(x)$ .

## Lemma

*Let  $P$  be a nonempty polyhedral convex subset of  $\mathbb{R}^n$  and let  $z_0 \in \mathbb{R}^n$ . Let  $x_0 = \Pi_P(z_0)$  and  $n_0^* = z_0 - x_0$ . There is a neighborhood  $Q$  of the origin in  $\mathbb{R}^{2n}$  such that*

$$[(x_0, n_0^*) + Q] \cap N_P = (x_0, n_0^*) + [Q \cap N_{\kappa_P(z_0)}]. \quad (1)$$

This lemma is extremely useful in the local analysis of variational problems, because it lets us change the underlying set from  $P$  to  $\kappa_P(z_0)$ , which often has a simpler structure.

The reduction  
lemma

The Sticky  
Face Lemma

Proof

Review

- Variational inequality problem: find  $x \in P$  such that  $\langle f(q, x), x' - x \rangle \geq 0$  for each  $x' \in P$ , where  $q$  is a parameter and  $f$  is continuous.
- Rewrite:  $0 \in f(q, x) + N_P(x)$ , equivalently  $[x, -f(q, x)] \in N_P$ .
- Given a solution  $x_0$  for parameter value  $q_0$ , suppose we want to investigate parameter values  $q'$  near  $q_0$ . Write this as  $[x, -f(q', x)] \in N_P$ .
- The reduction lemma says that for  $(x, q)$  close to  $(x_0, q_0)$  we can work instead with  $[u, -g(q', u)] \in N_V$ , where  $V = \kappa_P(x_0)$  and  $g(q', u) = f(q', x_0 + u) - f(q_0, x_0)$ .
- Rewrite the new problem as  $0 \in g(q', u) + N_V(x)$ ; now we have replaced  $P$  by the critical cone  $V = \kappa_P(x_0)$ .

The reduction  
lemma

The Sticky  
Face Lemma

Proof

Review

- Proof of reduction lemma given in *Math. Oper. Res.* 1991 is very short and simple (13 lines), but it requires a fact about polyhedral convex sets: the sticky face lemma.
- Direct proof in the 2d edition of Dontchev and Rockafellar's book *Implicit Functions and Solution Mappings: A View from Variational Analysis*, does not require the sticky face lemma, but it is longer.
- Unfortunately, the 1984 proof of the sticky face lemma is long, complicated, and not intuitive. We will give a shorter and more accessible proof.
- Having that, we also have a short and accessible proof of the reduction lemma.

## Lemma

*Let  $P$  be a nonempty polyhedral convex subset of  $\mathbb{R}^n$ . Let  $x_0^* \in \mathbb{R}^n$  and define  $F = N_P^{-1}(x_0^*)$ . Then there is a neighborhood  $U$  of  $x_0^*$  such that whenever  $x^* \in U$  one has*

$$N_P^{-1}(x^*) = N_F^{-1}(x^*). \quad (2)$$

The reason for the lemma's name is that it says the faces  $N_P^{-1}(x^*)$  cannot escape from the face  $F$  as long as  $x^*$  remains near  $x_0$ .

Review

We say two subsets  $X$  and  $Y$  of  $\mathbb{R}^n$  are *locally identical* at  $z \in \mathbb{R}^n$  if there is a neighborhood  $N$  of  $z$  such that  $X \cap N = Y \cap N$ .

A fact about barrier cones:

## Lemma

Let  $P$  be a convex subset of  $\mathbb{R}^n$  such that  $\text{bc } P$  is polyhedral, and let  $(x_0, x_0^*) \in N_P$ . Let  $F = N_P^{-1}(x_0^*)$ . Then:

a.  $\text{bc } F$  is polyhedral: specifically,

$$\text{bc } F = (\text{bc } P) + \text{pos}\{-x_0^*\}; \quad (3)$$

b.  $\text{bc } F$  and  $\text{bc } P$  are locally identical at  $x_0^*$ .

The proof of this lemma is straightforward convex analysis, using the properties of barrier cones.

# Key arguments

RL 2015  
11/ 13

SMR

Notation and  
definitions

The reduction  
lemma

The Sticky  
Face Lemma

Proof

Review

- Dispose of the case  $F = \emptyset$
- Use the lemma on the preceding slide to produce a neighborhood  $Q$  of  $x_0^*$  such that  $Q \cap \text{bc } F = Q \cap \text{bc } P$ .
- Observe that  $N_P^{-1}$  is a *polyhedral multifunction* (i.e., its graph is a finite union of polyhedral convex sets) and therefore there are a nonnegative  $\lambda$  and a neighborhood  $W$  of  $x_0^*$  such that whenever  $x^* \in W$  one has

$$e[N_P^{-1}(x^*), N_P^{-1}(x_0^*)] \leq \lambda \|x^* - x_0^*\|$$

- Observe that among the faces  $G$  of  $P$  that are not contained in  $F$  there is one that minimizes  $e(G, F)$  and this minimum  $\rho$  is positive

# Combining the arguments

RL 2015  
12/13

SMR

Notation and  
definitions

The reduction  
lemma

The Sticky  
Face Lemma

Proof

Review

- Choose a positive  $\alpha$  such that  $\lambda\alpha < \rho$  and let

$$U := Q \cap W \cap B(x_0^*, \alpha)$$

- If  $x^* \in U$  then  $e[N_P^{-1}(x^*), N_P^{-1}(x_0^*)] < \rho$  and therefore  $N_P^{-1}(x^*) \subset F$
- If  $N_P^{-1}(x^*)$  is empty then so is  $N_P^{-1}(x^*)$  ( $x^* \in Q$ )
- If  $N_P^{-1}(x^*)$  is nonempty then  $\langle x^*, \cdot \rangle$  has at least one maximizer on  $P$ , and all such lie in  $F$  and so are also maximizers on  $F$ . Then  $N_P^{-1}(x^*) = N_F^{-1}(x^*)$  and we are finished

The reduction  
lemma

The Sticky  
Face Lemma

Proof

Review

- The reduction lemma is an important tool for local analysis of variational problems posed over polyhedral convex sets.
- It has a very short proof provided that one has the sticky face lemma.
- We now have a fairly short and geometrically clear proof of the sticky face lemma.
